

AY 2025-26

Lab of Web Technologies

Outline of projects from AY 2024-2025

An outline of the projects from AY 2024-2025 follow:

- A web application for booking museum and cultural site tickets, integrated with AI-powered guidance and personalized recommendations. Its main functionalities include streamlining ticket purchasing and providing tailored cultural suggestions.
- A web application that generates personalized music playlists based on user moods and activities, allowing collaborative playlist creation with friends. The primary goal is to enable new music discovery with social interaction, shared experiences and sentiment analysis.
- A web application that recommends personalized events (concerts, festivals etc.) based on user preferences and a brief quiz. Its main function is to assist art enthusiasts in discovering suitable events through tailored suggestions.
- A web application for exploring new releases of music, creating playlists, and managing a personal library. Its main function is to facilitate music discovery, organization, and engagement in an online environment.
- A web application for a travel blog enabling users to share experiences and interact via likes and reactions. The main objective is to connect travel enthusiasts and build a community centered around discovering and sharing travel stories.
- A web application that tracks clothing usage to promote sustainable fashion by helping users rediscover less-used garments and reduce impulse buys. Its primary functionalities are to encourage conscious wardrobe management and support environmentally friendly fashion choices.
- A web application for documenting and exploring recurring dreams, presented as a personalized, visually immersive dream book. Its main features offer a functional and engaging platform for dream recollection, including animated, page-turning effects.
- A web application for students to rate, review, and compare nearby apartments, with features for property owners to manage listings and respond to reviews. Its main goal is to provide transparent, user-generated insights on housing options and facilitate rental decision-making for students and landlords.
- A web application that registers users' allergy information, and suggests personalized recipes. Its main goal is offering customized, allergy-aware culinary recommendations through an intuitive interface for safe and enjoyable cooking.
- A web platform for university students to share notes, learning materials, and exam resources. Its main purpose is to improve individual and collaborative study effectiveness through resource sharing and organized access.
